ALL-SKY SURVEY IN POLARIZED LIGHT

Antonio Mário Magalhães

IAG
Universidade de São Paulo

-
-
- *All-Sky Polarization Survey*

Summary

- **Introduction**
 - Why polarimetry?
 - Need for an All-Sky Optical Polarization Survey
- **The SGMAP Survey**
 - Hiroshima University
 - Status
- **The SOUTH POL Survey**
 - University of Sao Paulo
 - Status
- **Science from a Polarization Survey**
- **Collaboration between SGMAP & SOUTH POL**
 - Participation of TAO

SGMAP project: Summary

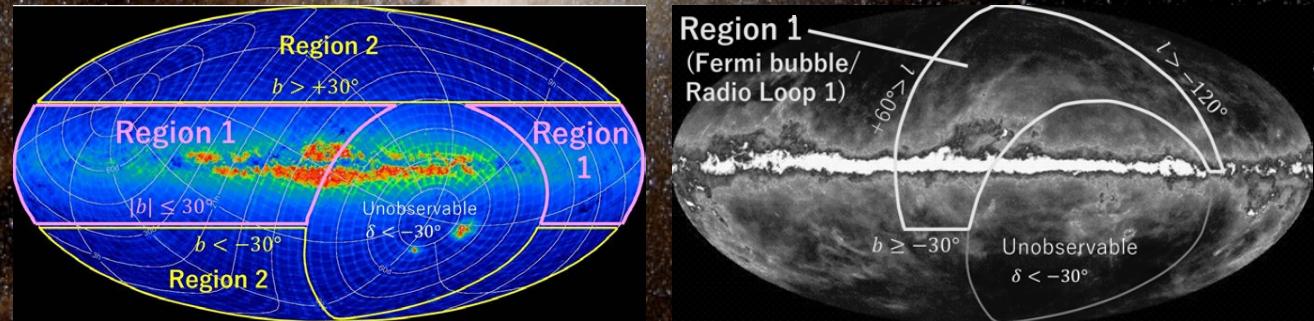

(Search for Galactic Magnetic-field by All-sky Polarimetric Survey)

Using a dedicated 1-m class Ground-based Telescope and
an optical 2-band (g' , I') Wide-field Polarimeter

Several million stars (< 14 mag, $\delta > -20^\circ$) will be surveyed in
optical 2 bands simultaneously

First homogeneous polarimetric survey in northern hemisphere

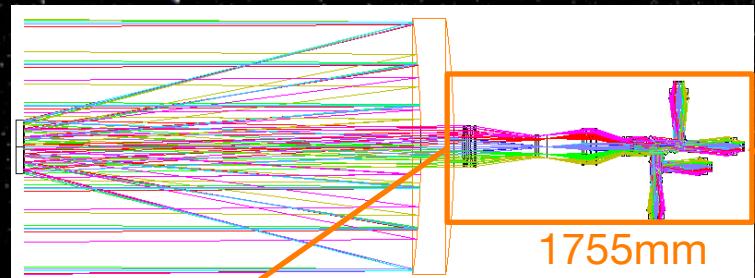

Development phase
~2.5 yr
Observation period
~4.5 yr
Data analyses phase
~3 yr

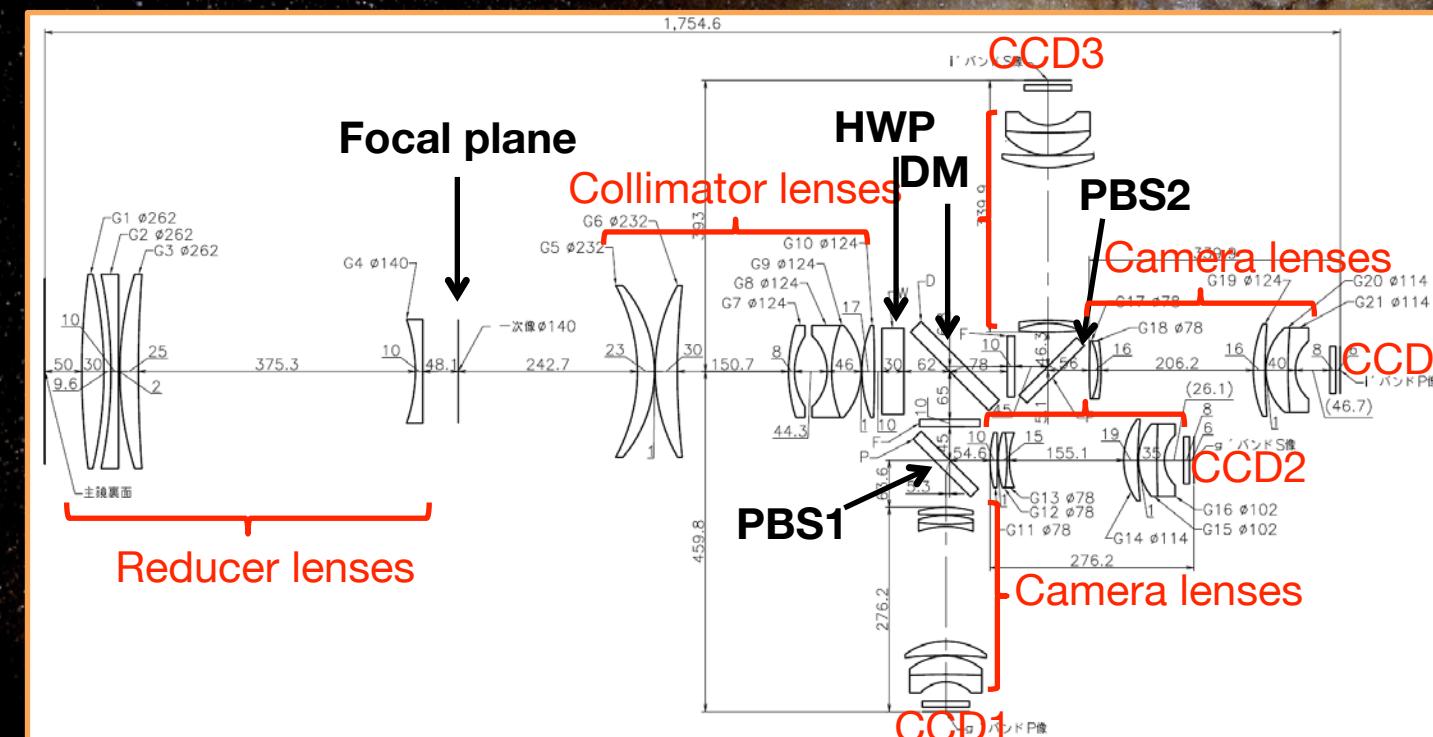

**90% observation time used to cover 60% all-sky within 4.5 yr.
10% for iterative observation of time variables (transients, etc.)**

It is still in a fund-raising phase. The budget is reduced to 2-4 million USD.

SGMAP: Instrument design

Main mirror: $D = 1.50\text{m}$; Secondary: $D = 0.3232\text{m}$;
Composite F ratio = 6.114 (including reducer);
Field of View 50' diameter; Final F ratio = 2.02 (at CCD)
Four 4k4k CCDs; Pixel scale $0.76''/\text{pixel}$ ($15\mu\text{m}$)

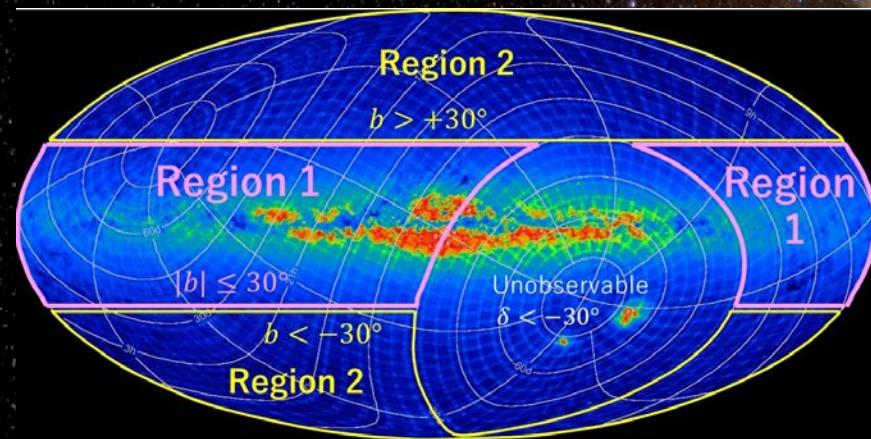

Any incident ray to HWP, DP and PBS is inclined less than 10° against the optical axis to keep their efficiency.

80% encircled energy radius $<0.7''$ over 50' FoV for g' and i' bands

SGMAP: Survey Plan

- With 40s×4 exposures, $\Delta p = 0.15\%$ @ $g' = 14.0$ mag
Seeing 1.8", Sky 18mag/arcsec², total efficiency 20%
- 1 set of observation takes 4.6 minutes (with overhead), 100 sets in one night (8 hr)
- Survey speed: 46.4 deg²/day

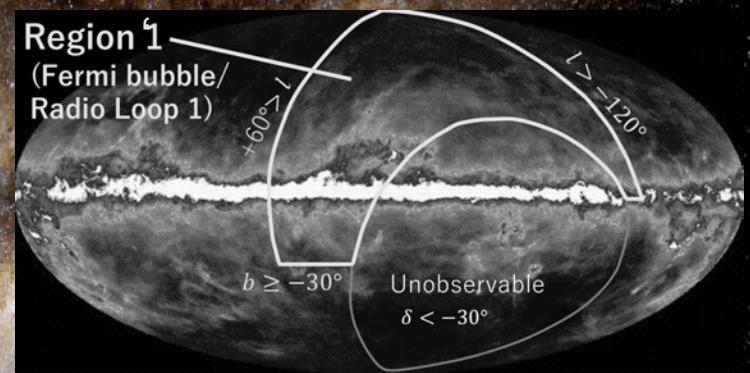

Region 1: Galactic plane survey

- $|b| < 30^\circ, l = \sim 0 - 220^\circ$ (12000 deg²)
- 12000/46.4 → taking 0.71 yr
- Weather factor 0.33 → 2.1 yr

Region 2: Mid-high latitude survey

- $|b| \geq 30^\circ$ available from Hiroshima (13200 deg²)
- Weather factor 0.33 → 2.4 yr

Region 1': Higher priority for multi-wavelength study of Galactic structures including Radio loop/Fermi bubble region.

SGMAP: Optimistic Schedule

Fiscal Year	Telescope/dome	Instrument	Observation/data reduction
2018	Final selection of candidate telescope	Design completion, fabrication of optical components	
2019	Refurbishment, installation	Detector unit Lens unit Assembling	
2020		Mounting to telescope Experimental observation	Survey obs. starts Region 1
2021-			Obs. Region 1
2023-			Obs. Region 2 Data reduction
2025-			(Obs. Region 2) Data reduction Catalogue release

IAGPOL's Optics

-
-
- *All-Sky Polarization Survey*

Introduction

- Mechanisms that originate optical polarized light:
 - Dust scattering
 - Interstellar Medium
 - Envelopes of Young Stellar Objects
 - Envelopes around AGB stars
 - Thompson (e^-) scattering
 - Cosmic Microwave Background
 - Envelopes of Hot Stars
 - Synchrotron radiation
 - Active Galactic Nuclei (AGN)
 - AGN hot spots
 - Gamma-ray Bursts (GRBs)
 - Cyclotron radiation
 - Magnetic cataclysmic binaries

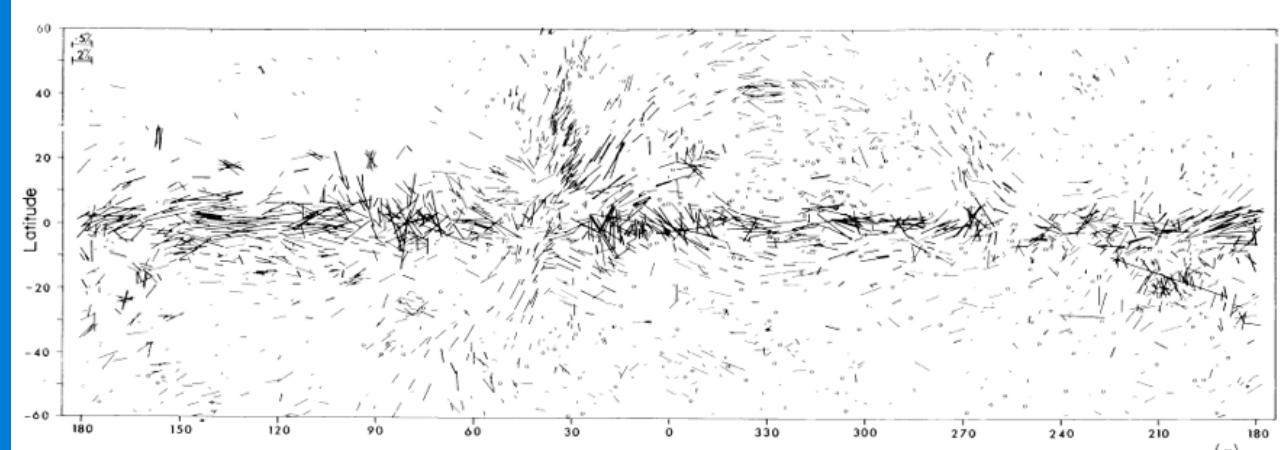

-
-
- *All-Sky Polarization Survey*

Introduction

- **Despite the scientific motivation,**
 - No all-sky O/NIR polarimetric Survey exists!
 - Eg., interstellar polarization:
 - Heiles' (2000) compilation has \sim 10,000 stars
- **SOUTH POL should provide \sim 10⁷ V \lesssim 15 objects**
 - deeper
 - more precise & accurate

Mathewson & Ford 1970

-
-
- *All-Sky Polarization Survey*

SOUTH POL

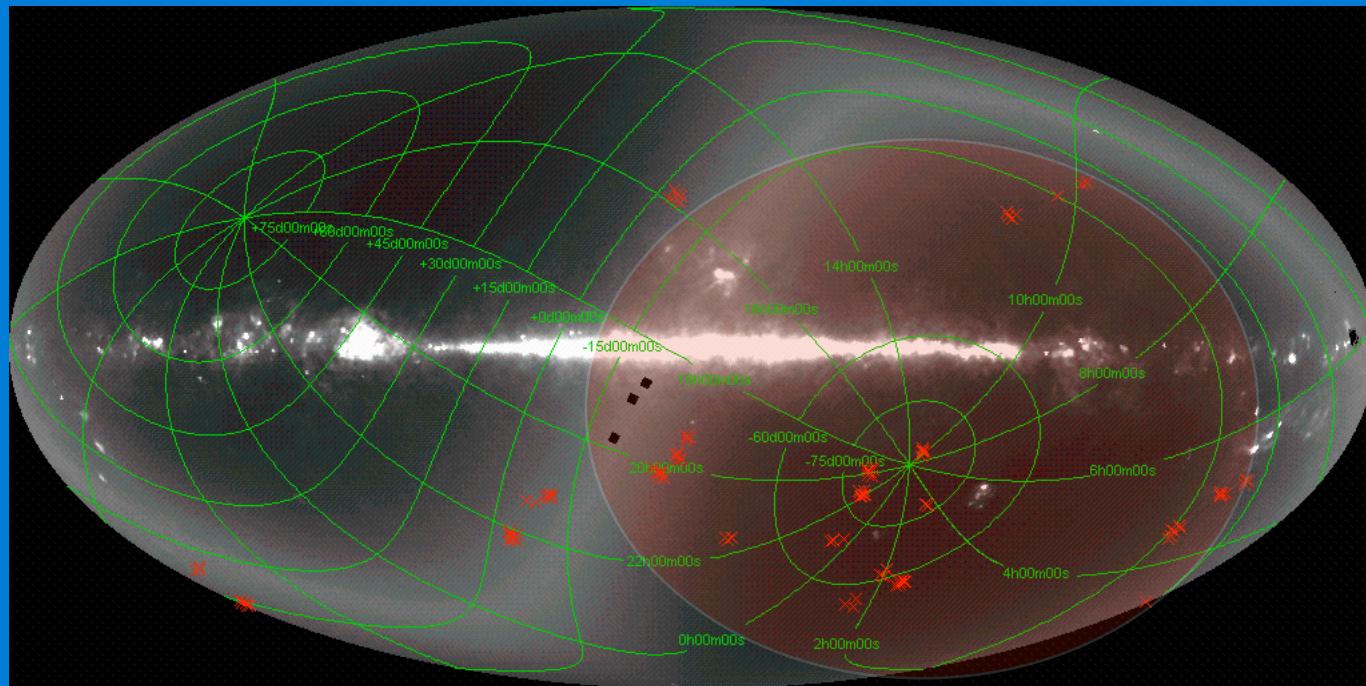

- **SOUTH POL:**
 - Optical survey of the polarized Southern sky
 - FAPESP, PI: A. M. M.
- **Goal:**
 - Polarimetric accuracy of 0.1% at V~15
- **Survey's first epoch:**
 - Sky South of Dec -15°
 - Complete in ~ 2 years of observing time
- **It will gradually progress towards North**

-
-
- *All-Sky Polarization Survey*

SOUTH POL

- **SOUTH POL:**
 - Optical survey of the polarized Southern sky

-
-
- *All-Sky Polarization Survey*

SOUTH POL

- **High Galactic Latitude Clouds**
 - From **models of stellar population synthesis** of the Galaxy:
 - $V \lesssim 15$:
covers 3 kpc towards $b=90^\circ$
 - In other words,
 - **Galactic dust layer will be well sampled!**

Table 1. Polarimetric accuracy, in %, with the 80cm Telescope(*)

V (mag)	8×60 sec	8×300 sec
10	0.022	0.010
11	0.035	0.016
12	0.055	0.025
13	0.088	0.039
14	0.140	0.062
15	0.223	0.100
16	0.361	0.160
17	0.600	0.263
18	1.051	0.449
19	2.011	0.830

(*) For a 22mag/arcsec², air mass=1, readout noise=5e⁻.

Calibration polarizers

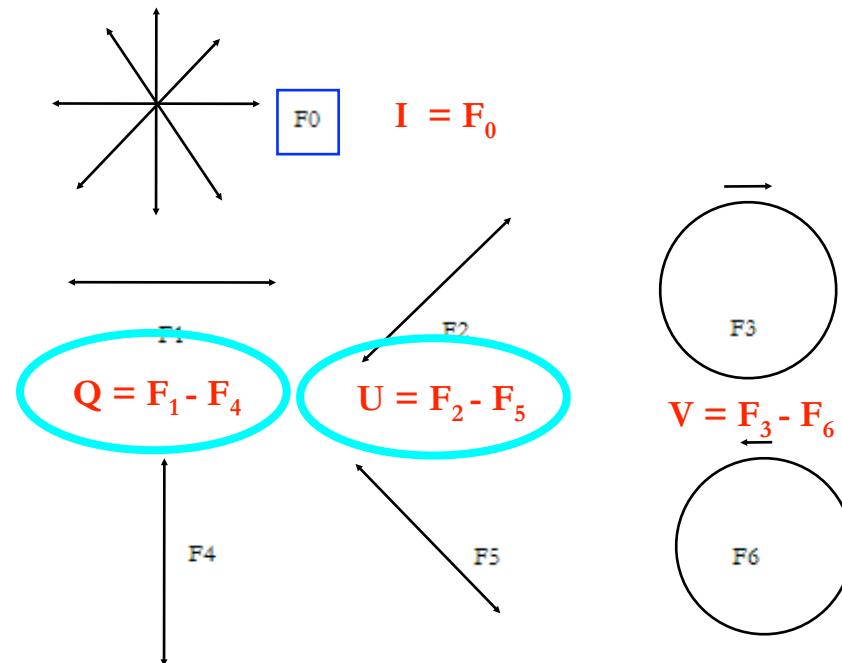

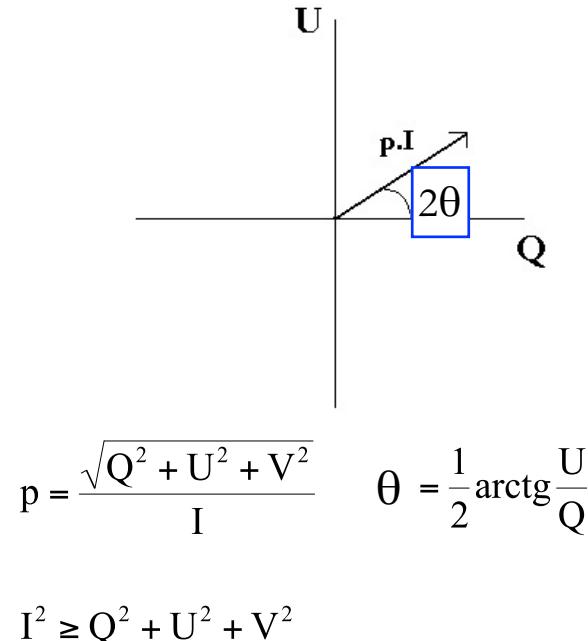

-
-
- All-Sky Polarization Survey

SOUTH POL

- Operational definition of the Stokes parameters [I, Q, U, V]

Consider the following ‘filters’ that measure the different polarization states:

-
-
- All-Sky Polarization Survey

SOUTH POL

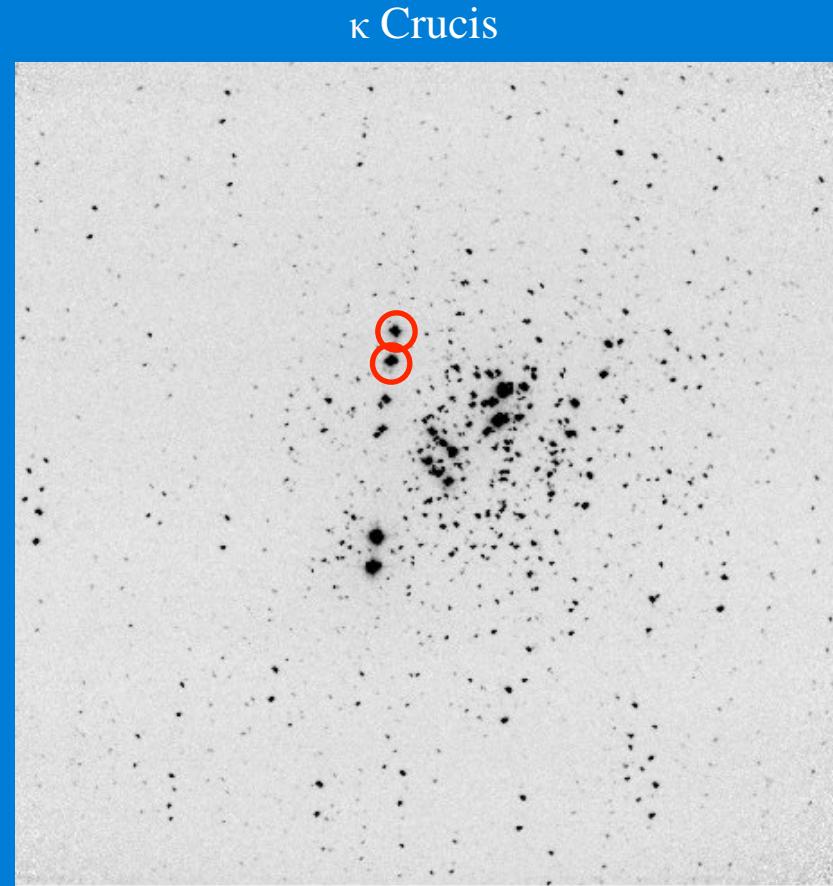

- Counts @ $\lambda/2$ -waveplate

angles ψ_i :

$$z_i = \frac{N_1 - N_2}{N_1 + N_2} |_i = Q \cdot \cos(4\psi_i) + U \cdot \sin(4\psi_i)$$

$$\Rightarrow \mathbf{Q} = 1/4 \times [z_1 - z_3 + z_5 - z_7]$$

$$\mathbf{U} = 1/4 \times [z_2 - z_4 + z_6 - z_8]$$

AMM et al. 2005

-
-
- *All-Sky Polarization Survey*

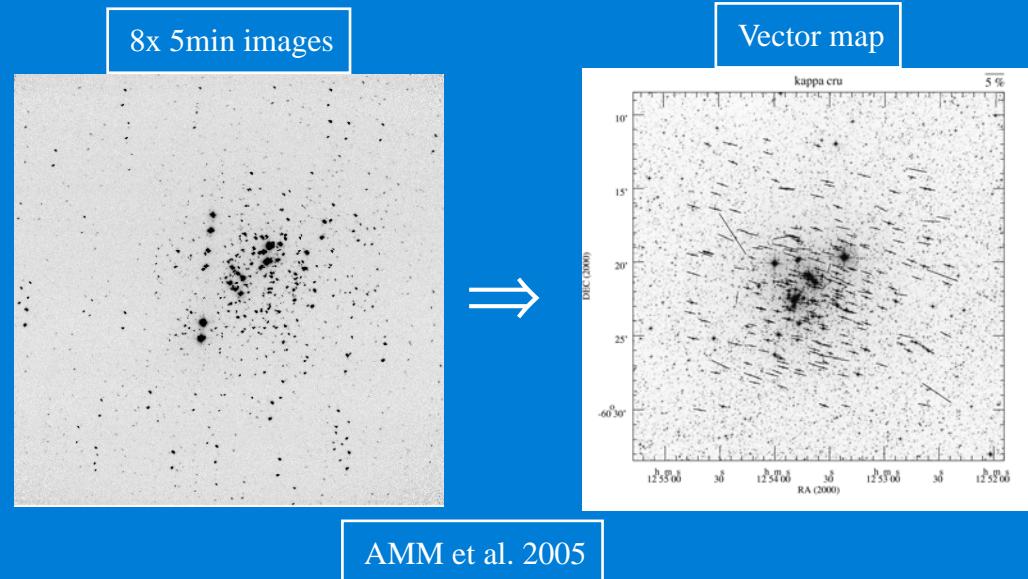

SOUTH POL

Reduction pipeline:

Need to convert
- images @ waveplate positions

to

- bias, flat, image reduction
polarization catalog
magnitude catalog
vector maps, ...

An IDL pipeline has been built for this purpose (Ramírez et al. 2017)

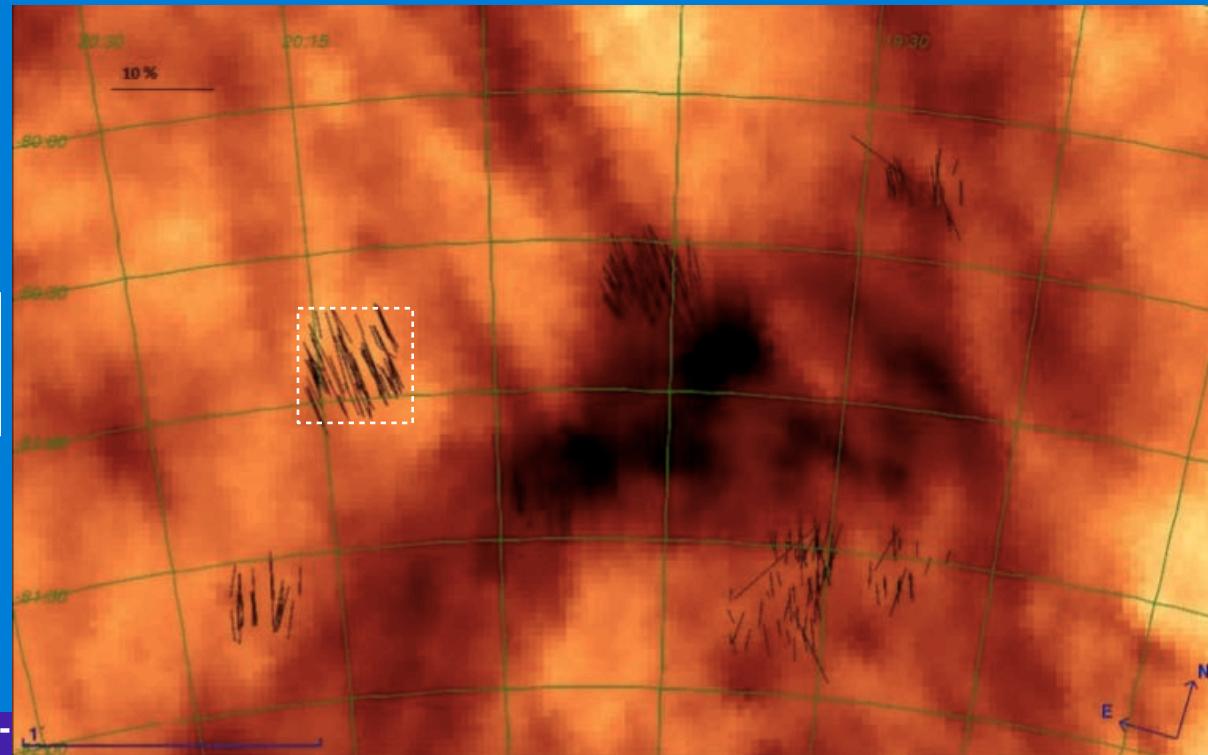

-

-
-
- *All-Sky Polarization Survey*

Commissioning Data

- **Run on November 13-17, 2017**
 - One night (Nov 17) worth of data
 - Six Fields of different characteristics
 - AGN
 - General ISM
 - Open Cluster, ...
 - **Results for Field ID_SP11981**

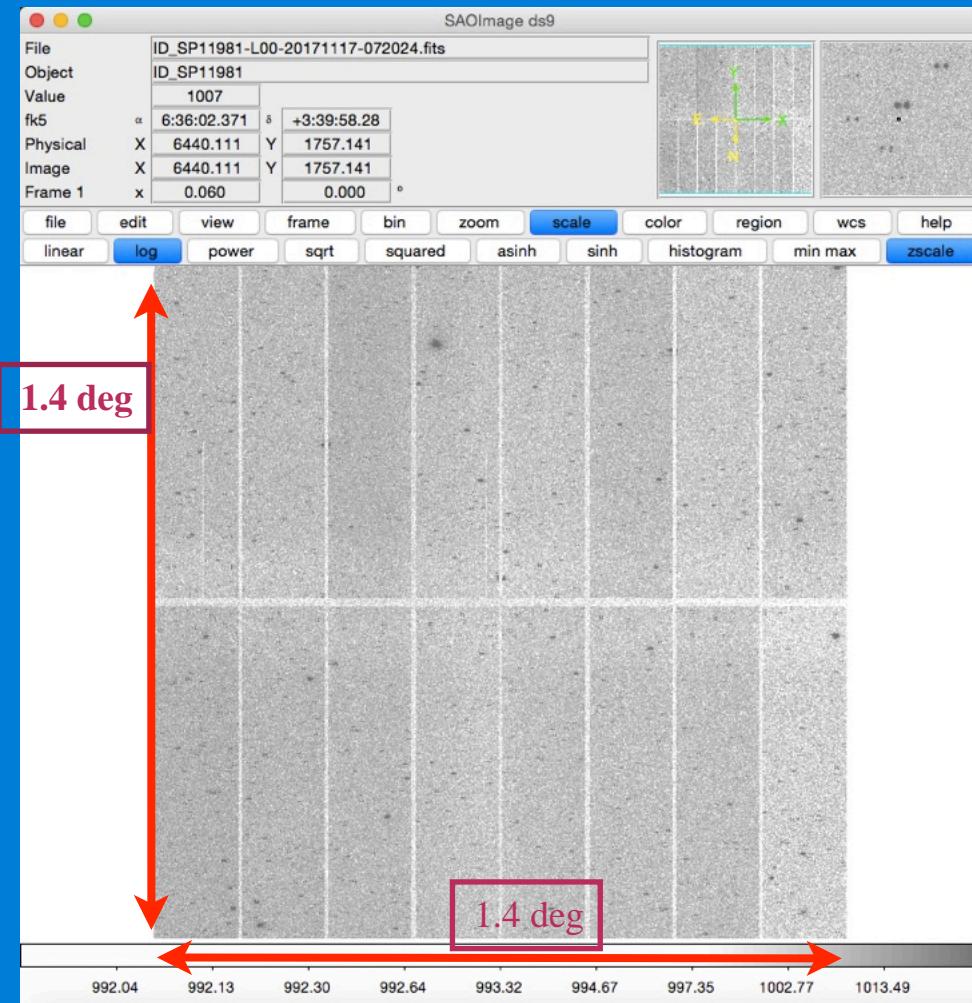

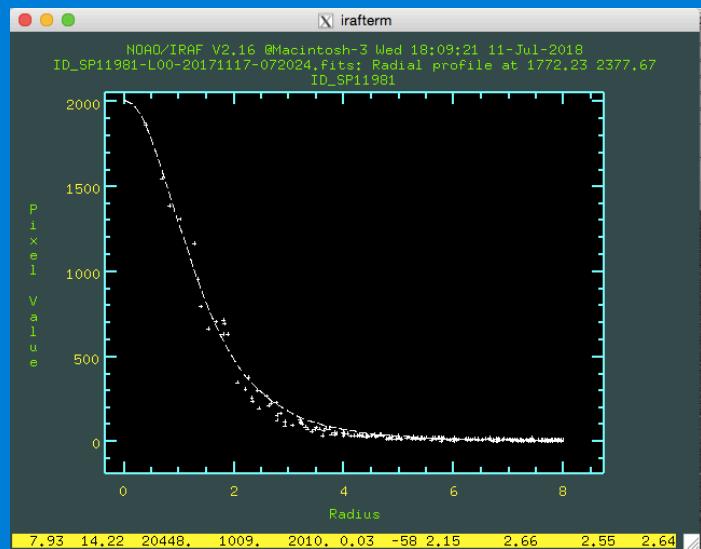

-
-
- All-Sky Polarization Survey

Commissioning Data

- Field ID_SP11981
 - 4 dithered images per waveplate position
 - IT = 4×10 sec
 - @ 8 pos. of waveplate
 - 22.5 deg apart

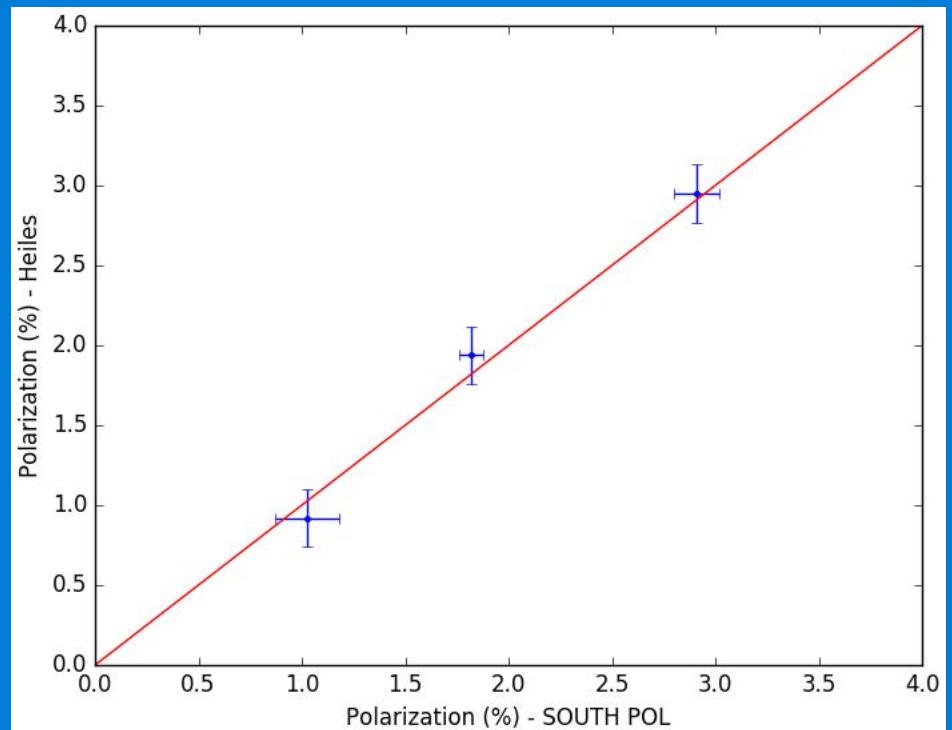

-
-
- *All-Sky Polarization Survey*

Commissioning Data

- Three objects with measured polarization (Heiles' 2000) vs. SOUTH POL
- RESULT: GOOD PRECISION

Field ID_SP11981

-
-
- All-Sky Polarization Survey

Commissioning Data

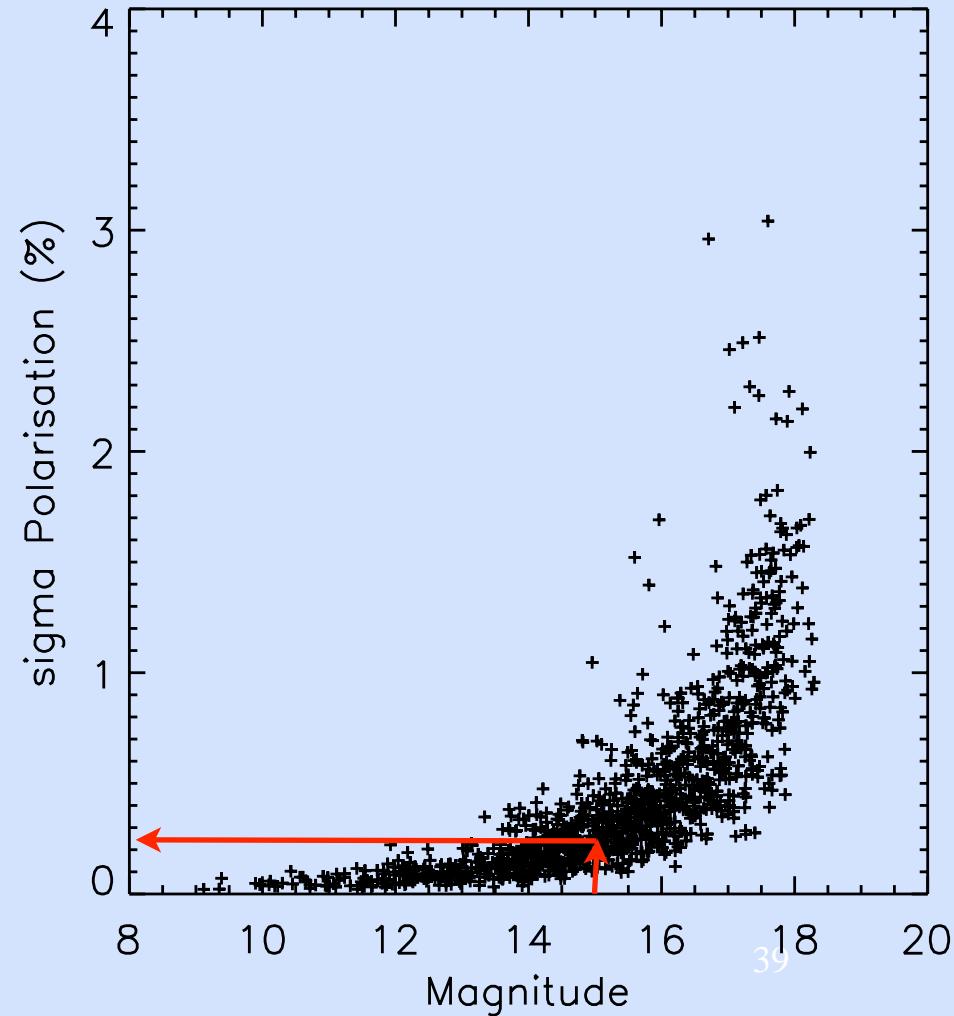

Field ID_SP11981:

Polarization error
vs.
Magnitude

$\sigma_p = 0.25\% @ V=15$
(40 sec/waveplate)

For a nominal exposure,
300 sec/waveplate:
 $\sigma_p = 0.09\% @ V=15$,

very close to the one expected
($\sigma_p = 0.1\% @ V=15$)

Chiang et al. 2010

Dowell et al. 2014; BICEP2 Collaboration

Contribution from Galactic Dust to BICEP2 results?

-
-
- *All-Sky Polarization Survey*

Impact - CMB

- For proper subtraction & analysis of CMB polarization:
 - Much improved sampling of starlight polarization is needed
 - **SOUTH POL & SGMAP** will hence be important
 - providing good sampling of interstellar polarization
 - for analysis of past & current missions: WMAP, Planck, BICEP2
 - for future missions: CMB-S4, Spider

-
-
- *All-Sky Polarization Survey*

Impact - Extragalactic Astronomy

- Identification of **EGRET & FERMI sources**
 - highly polarized blazars
- Known blazars
 - 450 Blazars with $R < 19$ e $\text{dec} < -15^\circ$
 - Massaro et al. (2009)
 - $R_{\text{median}} \sim 17$
 \Rightarrow SOUTH POL: unbiased survey
- Multi-messenger Astrophysics
 - GW + ELM sources
 - NS + BH event:
 expected to be very asymmetrical

Table 1. Polarimetric accuracy, in %, with the 80cm Telescope(*) .

V (mag)	8×60 sec	8×300 sec
10	0.022	0.010
11	0.035	0.016
12	0.055	0.025
13	0.088	0.039
14	0.140	0.062
15	0.223	0.100
16	0.361	0.160
17	0.600	0.263
18	1.051	0.449
19	2.011	0.830

(*) For a $22\text{mag}/\text{arcsec}^2$, air mass=1, readout noise= $5e^-$.

Jansson & Farrar 2012

- **3-D structure** of the Magnetic Field (w/ M. Havercorn/Radboud)
 - In development, using LNA data (Magalhaes et al. 2005)
 - Consistency with Synchrotron, Faraday rotation & Dust Polarization required

S1

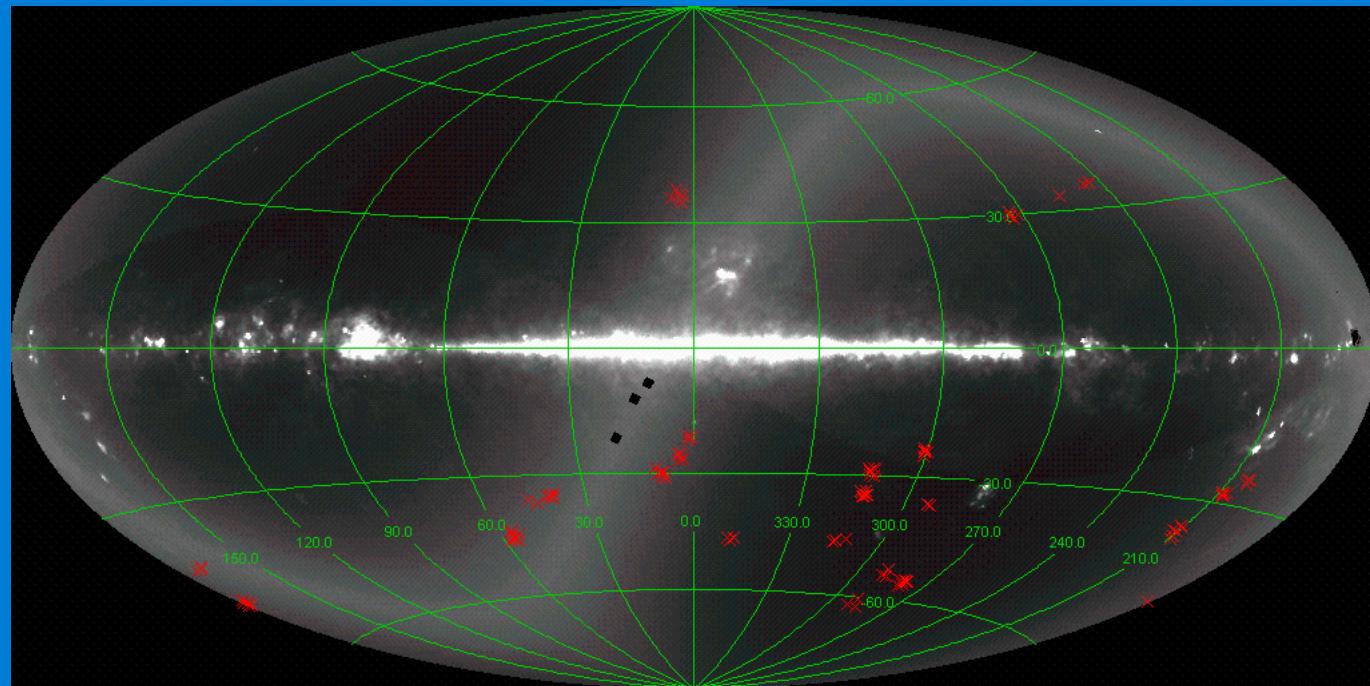

-
-
- *All-Sky Polarization Survey*

Impact - CMB

High Galactic Latitude Clouds

- Important for knowledge of Galactic Foreground for CMB
- Provide **structure of B-field away from the Galactic Plane**

-
-
- All-Sky Polarization Survey

Why?... B-field strength

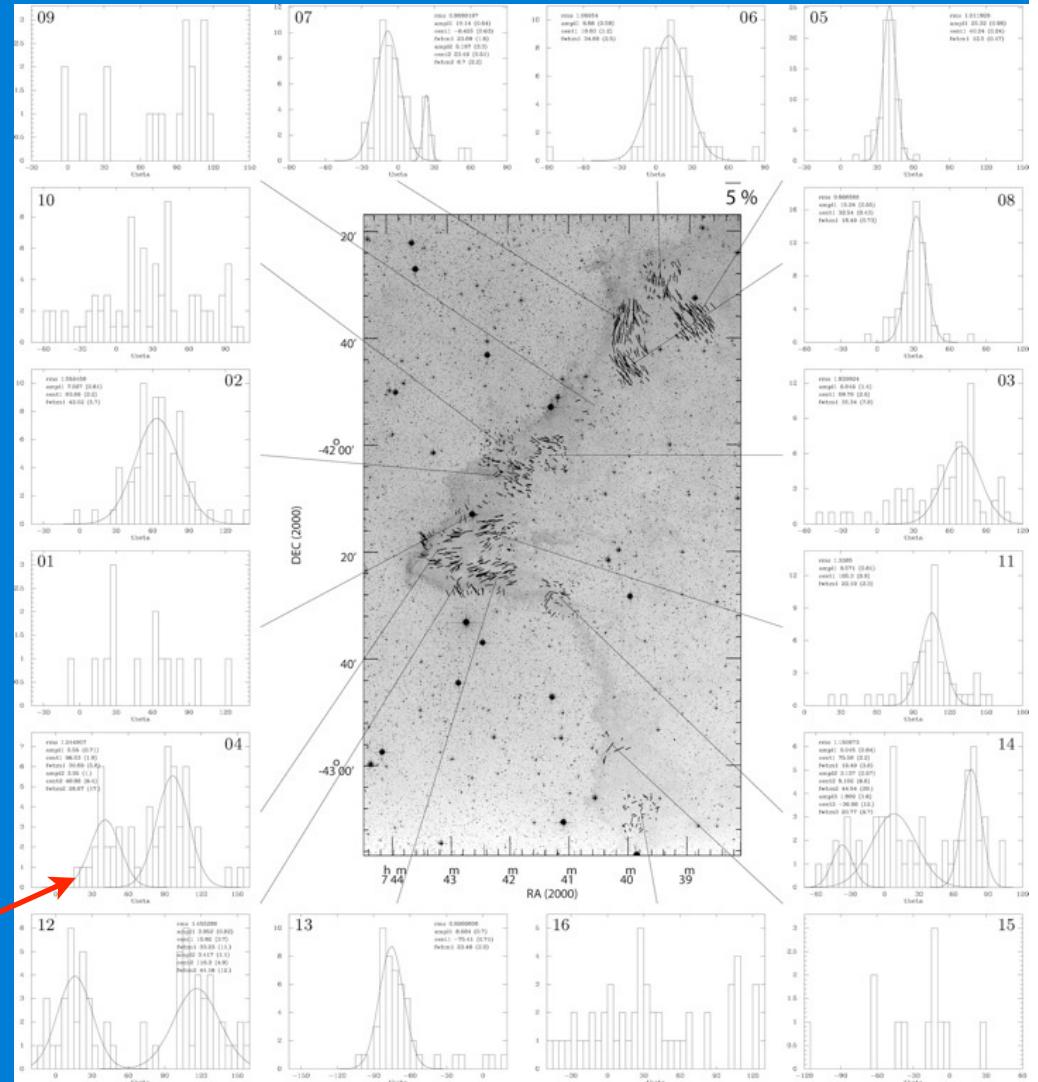

- Chandrasekhar & Fermi method
 - C & F (53)
- Equipartition between kinetic & perturbed magnetic energies
- + isotropic rms velocity:

$$\frac{1}{2} \rho \delta V_{\text{LOS}}^2 \sim \frac{1}{8\pi} \delta B^2$$

$$\Rightarrow [B_{\text{sky}} + \delta B \approx \sqrt{4\pi\rho} \frac{\delta V_{\text{los}}}{\tan(\delta\phi)}]$$
